Chapter 7 Institutions as Enablers of Science– Based Industries: The Case of Biotechnology in Mexico

Marcia Villasana Tecnológico de Monterrey, EGADE Business School, Mexico

ABSTRACT

Biotechnology impacts across different industrial uses of the life sciences, and has acquired a relevant role in addressing challenges faced by world economies such as those related to food, water, energy and healthcare provision. Many governments in emerging economies looking to exploit some of the opportunities provided by advances in biotechnology design institutional frameworks to cope and develop this complex science-based industry. In this context, a country's science, technology and innovation institutional structure plays a key role in shaping the outcomes, commercialization, investments, and alliance strategies of this particular industry. This chapter builds on the innovation systems perspective to describe how institutions act as enabling factors for innovation and research in biotechnology. These factors are, as defined by the Biotechnology Industry Organization, infrastructure for R&D, human capital, intellectual property protection, regulatory environment, technology transfer frameworks, market, and commercial incentives.

INTRODUCTION

The development path for science and technology-based industries is strongly linked to a co-evolutionary process with national institutions. Institutions provide the incentives that are key to economic actors by influencing the organization of production and investments in technology and physical and human capital (Acemoglu, Johnson, & Robinson, 2005). For emerging economies, such as Brazil, India, and China, this may be more preeminent, due to the stronger influence of government and society on both an organization's processes and decision making than in developed economies (Hoskisson, Lorraine, Lau, & Wright, 2000).

While still many institutions appear to best suit industries in which physical capital drives growth (OECD, 2014), for some new sectors and sub-sectors growth and expansion is highly dependent on the discovery and application of new technologies (Hirsch-Kreinsen et al., 2005). For those industries with special input and skill needs, their growth and effectiveness are "strongly conditioned by how rapidly and effectively a support structure grows up" (Nelson, 1994, p. 144).

The institutional system conditions the returns generated by investments in physical capital, human capital, or in new developments through laws that protect intellectual and industrial property, the prevention of improper appropriation of benefits, among other beneficial consequences (Giménez & Sanaú, 2007). The level of institutional development supporting technological innovations conditions how institutions might change a sector's distance to the technological frontier (Aghion, 2006), thus impacting a country's level of economic growth (Aghion, 2006).

One of the technologies that have opened new economic spaces is biotechnology (Kenney, 1998). It is regarded as essential for ensuring long-term economic development as well as environmental sustainability (OECD, 2014). The rapid advancements in biotechnology address the challenges that the world is facing today in the provision of water, food, energy, and human and animal healthcare (OECD, 2009a); however, for nations it poses the challenge of being a global issue due to concerns such as environmental and health risks and the influence of developed countries on policy, trade, and investments (Aerni & Reider, 2001).

For many, modern biotechnology is considered a new economy industry that is rather young, with a little over four decades of existence (BIO, 2015). Still, some consider that biotechnology is not an industry in itself, with no Standard Industrial Classification (SIC) code as yet (Hermans, Kulvik, & Ylä-Anttila, 2005; Niosi & Reid, 2007). In most advanced industrial countries biotechnology is an enabling technology for other industries (Kenney, 1998). Biotech-derived products and services have applications in different industrial sectors such as pharmaceuticals, agriculture, food processing, chemicals, among others (Bartholomew, 1997; Kenney, 1998; Niosi, 2011). 34 more pages are available in the full version of this document, which may be purchased using the "Add to Cart" button on the publisher's webpage: <u>www.igi-</u> <u>global.com/chapter/institutions-as-enablers-of-science-</u> based-industries/169518
