

# The Nature, Extent, Causes, and Consequences of Cyberbullying

C

**Michelle F. Wright**

*Masaryk University, Czech Republic*

## INTRODUCTION

Children and adolescents spend a great deal of time using and interacting through electronic technologies, including cell phones, gaming consoles, and the Internet. Some of their engagement with electronic technologies involves many benefits, such as the ability to engage in quick communication with just about anyone, including friends and family, and having access to a multitude of rich information. Despite the many opportunities afforded by electronic technologies, many children and adolescents are exposed to risks. One risk associated with electronic technology usage among adolescents and children is cyberbullying. Cyberbullying occurs through electronic technologies, including gaming consoles, email, instant messaging, chatrooms, social media, and text messages via mobile phones. The literature in this chapter draws on research from various disciplines, including communication, computer science, education, media studies, psychology, social work, and sociology. Furthermore, the literature involves a variety of different research designs, including cross-sectional and longitudinal methodologies as well as qualitative and quantitative designs. The chapter is organized into the following eight sections:

1. The first section provides a background of the nature of cyberbullying by focusing on defining it and describing the technologies used to target others and the features of anonymity as applied to cyberbullying.
2. The second section describes the extent of cyberbullying by focusing on the prevalence rates of children's and adolescents' involvement in cyberbullying.
3. The third section describes the individual characteristics and risks associated with children's and adolescents' involvement in cyberbullying.
4. The fourth section details the role of parents and families in children's and adolescents' cyberbullying perpetration and victimization.
5. Similar to the fourth section, the fifth section explains the role of peers and school in children's and adolescents' cyberbullying involvement.
6. The purpose of the sixth section is to review literature on the psychological, behavioral, and academic consequences associated with cyberbullying involvement among children and adolescents.
7. The seventh section discusses future research directions.
8. The final section provides concluding remarks on cyberbullying.

## BACKGROUND

As deliberately embarrassing or intimidating, cyberbullying involves the usage of modern electronic technologies to harm others using hostile and repetitive behaviors (Wolak, Mitchell, & Finkelhor, 2007; Ybarra, West, & Leaf, 2007). Cyberbullying is described as an extension of traditional face-to-face bullying, and it also includes elements of an imbalance of power between the bully and the victim as well as the incorporation

DOI: 10.4018/978-1-5225-2255-3.ch150

of a technological component (Olweus, 1999). These behaviors are repetitive, deliberate, and intentionally carried out by bullies with malicious intent. Similar to traditional face-to-face bullying, cyberbullying can also include behaviors with a face-to-face equivalent, such as spreading a rumor about a victim, harassment, physical threats, social exclusion, humiliation, gossiping about a victim to get others not to like the victim, and/or verbal insults. There are also physical forms of cyberbullying, like in traditional face-to-face bullying, which can include hacking. It can include making anonymous phone calls, theft of identity information by pretending to be someone else, distributing explicit videos via various websites, and harassment using instant messenger, social networking websites, and text messages through mobile phones (Wolak et al., 2007; Ybarra & Mitchell, 2004). Other forms of cyberbullying involve happy slapping and flaming (Smith et al., 2008). Furthermore, cyberbullying can involve using various electronic technologies, instant messaging tools and social networking websites.

Researchers have attempted to understand why children and adolescents engage in cyberbullying. One proposal is that new electronic technologies allow cyberbullies to hide their identities, furthering the power differential between the cyberbully and the cybervictim (Wright, 2013; Ybarra et al., 2007). Many children and adolescents who engage in cyberbullying choose to remain anonymous while perpetrating cyberbullying (Dehue, Bolman, Vollink, & Pouwelse, 2012; Wright, 2014a; Ybarra & Mitchell, 2004). Another proposal relates to new electronic technologies' ability to allow the cyberbully to perpetrate frequent, repeated, and prolonged harassment (Wright, 2014a; Ybarra & Mitchell, 2004). Wright (2013; 2014a) found that when individuals felt more confidence in their ability to remain anonymous while using electronic technologies they engaged in more cyberbullying, especially when they could perpetrate cyberbullying anonymously.

## THE EXTENT OF CYBERBULLYING

When an awareness of cyberbullying was gained by researchers, there were many studies conducted to understand how frequently children and adolescents were involved in these behaviors. In 2007, Wolak and colleagues (2007) conducted one of the earliest studies on cyberbullying in the United States. They found that 50% of children and adolescents in their sample were victimized by cyberbullying. Lower prevalence rates have been found in other studies conducted on cyberbullying involvement in the United States. For instance, Kowalski and Limber (2007) found that 11% of their 3,767 sample from middle school (aged 11-14) were victimized by cyberbullying, 4% had cyberbullied others, and 7% were classified as cyberbullies-cybervictims. Similar estimates were found in a study of cyberbullying by Patchin and Hinduja (2006). Among their sample, 29% of participants reported that they were cybervictims, while 47% reported to have witnessed cyberbullying at least once. More recent research revealed that 4.9% of children and adolescents in their sample ( $N = 4,441$ , 6-12<sup>th</sup> grade) were cybervictims within the past 30 days (Hinduja & Patchin, 2013).

Increasing evidence indicates that cyberbullying is not localized to one country. Instead, research has revealed that cyberbullying is a global concern. In one study, Cappadocia et al. (2013) found that out of their 1,972 sample of Canadian 10<sup>th</sup> graders, 2.1% perpetrated cyberbullying, 1.9% were cybervictims, and 0.6% were cyberbullies-cybervictims. Rates of cyberbullying involvement have also been examined in Australia as well. In this research, Campbell and colleagues (2012) found that 4.5% of their sample ( $N = 3,112$ ; grades 6-12<sup>th</sup>) were victims of cyberbullying. Research has also documented cyberbullying involvement among European children and adolescents. Using a large sample of Swedish adolescents ( $N = 22,544$ ; ages 15-18), Laftman et al. (2013)
