Chapter 5.19 ERP Adoption in Indian Organizations

Monideepa Tarafdar University of Toledo, USA

INTRODUCTION

Enterprise resource planning (ERP) systems integrate various functions and processes in organizations. ERP software is developed in the form of different modules, each of which helps to perform distinct functions within the company. The modules interface with the same database and are integrated so that workflows can be designed across different modules. The software helps standardize business processes and ensures organization-wide availability of transaction data. ERP software evolved from earlier manufacturing resource planning (MRP) systems, which included inventory management, procurement and production planning functions. The implementation of ERP software started in the early 1990s and during the late 1990s, the growth rate of the ERP market was between 30 to 40%. As of 2001, 30,000 companies around the world had implemented ERP and the total value of the ERP market was at \$25 billion. There is not much literature relating to ERP implementation and adoption in companies in Asia and other parts of the developing world. These organizations face issues that are significantly different from those faced by organizations in the developed world, because of differences in the sophistication of IT use, and in the cultural and social contexts. In this article, we describe some experiences that companies in India have gone through in implementing ERP systems. We present a framework for analyzing the critical factors and issues that influence the ERP adoption process, and highlight the areas of opportunity and risk. The framework is sufficiently general so as to be extended to other developing countries.

BACKGROUND

The implementation of ERP software is quite different from traditional software development. ERP software is a single program that is bought off the shelf and then configured to include the specific characteristics of processes of individual companies. Parts of the software have to be customized such that they can correctly represent the workflow and processes of the particular company. This is a complex process, requiring many activities to be carried out. Most studies have described the implementation process in terms of stages.

Ross and Vitale (2000) suggest that ERP implementation is done in five stages. The *design* phase deals with planning and standardization, where an organization chooses the specific package and decides on the extent of customization required. In the *implementation* stage, the software is implemented and goes live. In the stabilization phase, the firm adjusts to the new system and integrates it into its existing operations by identifying and smoothing out integration hiccups. The continuous improvement stage is marked by additions to the existing functionality of the ERP package through add-ons from other vendors. Organizations typically implement data warehousing, data mining, customer relationship management (CRM) and supply chain management (SCM) software to augment the transaction-based capabilities of the ERP software. In the *transformation* stage, the organization starts to see the benefits of the ERP system, in terms of more efficient processes and possibly better information exchange with partners, leading to flexibility and responsiveness.

Rajagopal (2002) proposes a six-stage model. In the initiation stage, organizations study possible business benefits, such as IT infrastructure integration and business process re-engineering, which might make ERP adoption necessary. The adoption stage consists of activities such as investment decisions and cost-benefit analysis related to choice of the package and the vendor. In the adaptation stage, the system is implemented and becomes available for use. In the acceptance stage, users become more comfortable with using the ERP system, their requirements are incorporated, and the overall benefits of the system become apparent. In the routinization stage, system integration is realized, users fully accept the system and its use becomes a routine activity. Finally, during the *infusion* stage, the organization looks to the next level of benefits that might be available. The organization moves beyond "just" using the system—it uses the available information to enhance the performance of different functions.

In the model proposed by Markus and Tannis (1999), the *chartering* stage comprises review and selection of the package and consultants, and clarifying the business related factors that make ERP a necessity. The *project* stage describes different aspects of the implementation process and consists of project management, software customization and process re-engineering. During the *shakeout*, managers familiarize themselves with the software. System bugs are reported and fixed and the operational effects on the business are felt. Finally in the *upward and onward* phase, strategic business benefits from ERP occur, additional technical skills are built and upgrades are planned for.

ERP implementation results in significant changes in the IS architecture, redesign of process, increased managerial competence and comfort with new technology and a greater role for IT in critical processes (Scott et al., 2000). A number of factors influence the ERP adoption process. First, strong leadership support is important for ensuring the availability of resources and manpower, and for signaling to the employees the importance of the software (Baskerville et al., 2000; Bingi et al., 1999; Markus, 1999; Parr et al., 1999; Sarkar et al., 2000). Second, open and honest communication about the ERP initiative results in greater understanding of organizational needs and hence quicker acceptance of the software (Davenport, 1998; Holland et al., 1999; Mendel, 1999). It also helps employees understand the rationale for ERP implementation and enables them to appreciate problems in existing systems. A third influencing factor is the skill and competencies of the implementation team. Implementation teams that are technically strong, empowered to make decisions, politically close to important people in the organization and have a good understanding
