

Chapter 24

Hyper-Sensitivity in Global Virtual Teams

Andre Araujo
Texas A&M University, USA

ABSTRACT

This chapter broadens the understanding of global virtual teams by integrating two theoretical approaches—the hyper-personal perspective and the social constructionist theory—to examine how members of global virtual teams develop relational interactions and outcomes. Specifically, the integrated research model presented here suggests that global virtual team members are hyper-sensitive to their computer-mediated interpersonal interactions in that individuals’ socially constructed perceptions of the context influence their relational development and judgments much more intensively than those of collocated members. The chapter offers managerial suggestions and research directions.

INTRODUCTION

Increasingly multinational enterprises are implementing global virtual teams. In such online collaborative settings, developing shared understanding and managing interpersonal conflict may be constrained by the fact that members have little of the traditional mechanisms that are used to engage in personal interactions with others, observe fellow team members at work, or develop a shared history of professional accomplishments. In addition, members of virtual teams may be thousands miles away from each other and possess different cultural background. Due to the absence of proximal interactions, virtual team members are likely to evaluate others based on amplified perceptions of their computer-mediated social interaction (Walther, 1996). This chapter examines hyper-sensitivity in virtual teams and its consequences to team’s relational interactions and outcomes. Specifically, the following research question is addressed: *What are the mechanisms that influence levels of engagement and interpersonal conflict in global virtual teams?*

DOI: 10.4018/978-1-5225-7362-3.ch024

BACKGROUND

Typically, global virtual teams employ web-based collaboration tools such as Trello, Basecamp, and Sync. in, to name a few (Gilson, Vartiainen, & Hakonen, 2015). While recent web-based technologies provide a great deal of functionalities, anecdotal and empirical evidence suggest a number of challenges faced by teams who rely on computer-based technologies to communicate and accomplish their tasks. Some of the challenges include overcoming isolation among team members, cultural differences, less time for relationship building, lack of participation, conflict management, and building trust.

This chapter broadens our understanding of this phenomenon by integrating two theoretical approaches—the Hyper-personal Perspective and the Social Constructionist Theory—to examine how members of global virtual teams develop relational interactions. Specifically, the integrated research model presented here suggests that global virtual team members are hyper-sensitive to their computer-mediated interpersonal interactions in that individuals' socially constructed perceptions of the context influence their relational development and judgments much more intensively than those of collocated members.

In this study, the key components of the context are the task-at-hand and shared identity, while relational interactions are defined in terms of interpersonal conflict and level of engagement. Thus, how members of global virtual teams perceive their task and their team will profoundly affect their relational interactions, including how much conflict they experience and how engaged they view their team members as being. Over time, the amplification of these affective elements will affect their judgments about their fellow members' trustworthiness. The main components of our research model and its relationships are depicted in the Figure 1. In the following sections we describe the research model (Figure 1), its components, and their combined impact on relational interactions in global virtual teams.

RESEARCH MODEL

The Hyper-Personal Perspective

Walther (1996) suggests that the meaning inherent in messages is amplified when individuals have limited physical contact with each other and therefore develop perceptions about others and their relationships
