

# Chapter 24

## Distance Teaching and Learning Platforms

**Linda D. Grooms**  
Regent University, USA

### ABSTRACT

*The knowledge explosion, the increased complexity of human life, and the ubiquitous, 24/7 nature of technology coupled with the globalization of the marketplace herald the need to embrace the most effective methods and formats of teaching and learning. Currently providing powerful educational opportunities, the science and technology of distance learning continues to multiply at unprecedented rates. Where historically traveling from village to village verbally disseminating knowledge was the only process of training those at a distance, today's learners eagerly embrace the rapidly expanding web-based delivery systems of the 21<sup>st</sup> century, which offer a plethora of educational alternatives. So, with this rapidly changing distance educational landscape, one must question, what exactly is distance teaching and learning, how has it evolved, and what is its future?*

### INTRODUCTION

The knowledge explosion, the increased complexity of human life, and the ubiquitous, 24/7 nature of technology coupled with the globalization of the marketplace herald the need to embrace the most effective methods and formats of teaching and learning. Currently providing powerful educational opportunities, the science and technology of distance learning continues to multiply at unprecedented rates. Where historically traveling from village to village verbally disseminating knowledge was the only process of training those at a distance, today's learners eagerly embrace the rapidly expanding web-based delivery systems of the 21<sup>st</sup> century, which offer a plethora of educational alternatives. So with this rapidly changing distance educational landscape, one must question, what exactly *is* distance teaching and learning, how has it evolved, and what is its future?

## **BACKGROUND**

In very simplistic terms, distance learning is just that--learning that occurs at a distance (Rumble & Keegan, 1982; Shale, 1990; Shale & Garrison, 1990) or that which is characterized by a separation in geographical proximity and/or time (Holmberg, 1974, 1977, 1981; Kaye, 1981, 1982, 1988; Keegan, 1980; McIsaac & Gunawardena, 1996; Moore, 1973, 1980, 1983, 1989a, 1989b, 1990; Ohler, 1991; Sewart, 1981; Wedemeyer, 1971). In his 1986 theory of transactional distance, Moore (Moore & Kearsley, 1996) defined distance not only in terms of place and time but also in terms of structure and dialogue between the learner and the instructor. In this theory, distance becomes more pedagogical than geographical. As structure increases, so does distance. As dialogue increases, distance declines thus establishing the foundational role interaction plays in the distance learning environment. Saba (1998) furthered this concept concluding,

*... the dynamic and systemic study of distance education has made 'distance' irrelevant, and has made mediated communication and construction of knowledge the relevant issue .... So the proper question is not whether distance education is comparable to a hypothetical 'traditional,' or face-to-face instruction, but if there is enough interaction between the learner and the instructor for the learner to find meaning and develop new knowledge. (p. 5)*

To facilitate greater interaction in the geographically and/or organizationally dispersed distance environment, today the convergence or fusion of technologies enable individuals to overcome the barrier of separation, affording institutional and learner opportunity to transcend intra- and inter-organizational boundaries, time, and even culture. By definition, the paradigm of distance, online, or e-learning revolutionizes the traditional environment; however, even with this change, learning, which involves some manner of interaction with content, instructor, and/or peers, remains at the core of the educational process.

Although imperative in both environments, research shows these three types of interaction to be the hub of the ongoing traditional versus distance argument. Traditionalists often fear that with anything other than face-to-face instruction, interaction somehow will decrease thus making learning less effective, when in reality, numerous studies have revealed no significant difference in the learning outcomes between traditional and distance courses (Russell, 1999). In fact, distance courses have been found to "match conventional on-campus, face-to-face courses in both rigor and quality of outcomes" (Pittman, 1997, p. 42). Despite these findings, critics still abound.

Two distinguishing characteristics of the nontraditional environment--individualized learning and flexibility--often arouse suspicion and caution among traditionalists (Grooms, 2000). Many are convinced that with any form of study outside the confines of the typical brick and mortar, "every vestige of intellectual rigor [will] disappear into oblivion. . . . [These skeptics interpret] individualized learning as individualized isolation, especially from faculty, and they look on flexibility as no more than a synonym for escape from regulation and responsibility" (Gould, 1972, p. 9).

In contrast, with their introduction of Equivalency Theory, Simonson, Schlosser, and Hanson (1999) accentuated the concept of equivalency as "central to the widespread acceptance of distance education" (p. 72) thus supporting Keegan's (1989) call for parity in quality, quantity, and status. Further, recognizing the need to bring integrity and prestige to the field, Shale and Garrison (1990) suggested building a
