ABSTRACT

Smart city deals with the problems of rapid urbanization and population growth by optimal utilization of all available resources. There are other driving factors such as clean energy programmes, a low carbon economy and distributed energy resources that are included in a smart city concept. Therefore, in this article, the authors proposed a clean energy generating model by utilizing the kinetic energy of vehicles over a speed breaker. The article focused on the design, modelling, and simulation of an electromechanical system for generating electrical power from the kinetic energy of vehicles passing over speed breakers. To facilitate simulation, a model of the electromechanical system is developed in MATLAB/Simulink. Further, MULTISIM 14 software is utilized for power electronic device modelling and simulation. Simulation results for power generation are obtained considering four units of rotational induction generators and two units of translational induction generators.

KEYWORDS

Boost Converter, Inverter, Rotational Induction, Translational Induction

VARIABLES

ω_{ratchet} Angular speed of the ratchet gear

ω_{pinion} Angular speed of the pinion gear

N_{ratchet} No. of tooth on ratchet gear

N_{pinion} No. of tooth on pinion gear

δ Deflection of a spring

d Diameter of a wire

n Number of springs

G Modulus of rigidity

R Mean diameter of a spring coil

W Effective designed load

n_a Number of active spring turns

n_t Total number of spring turns

DOI: 10.4018/IJCESC.2018040101

p Pitch of a spring

l Actual length of a spring
 n_t Total number of spring turns
 P Developed Power
 K spring constant
 g Acceleration due to gravity
 x Spring deflection length
 Φ Flux per pole
 Z Total number of armature conductors
 E_g Induced EMF in any parallel path in armature
 μ_0 Permeability of a free space
 z Relative axial distance from the center of the coil to the magnet
 r Average coil radial distance from the centre of the magnet
 B_ρ The radial component of the magnetic flux density
 l_w Total length of the coil wire inside the magnetic field
 μ_0 Permeability ($4\pi \times 10^{-7} \text{ N/A}^2$) of a vacuum,
 μ Magnetic dipole moment
 σ Electric conductivity
 v Velocity of the magnet
 N Number of turns wrung on the cylindrical pipe external part
 V_i Input voltage
 V_o Average output voltage
 t_{on} “ON” state duration
 t_{off} “OFF” state duration
 T_s Switching period
 D Duty cycle
 I_i Average input current
 I_o Average output current
 f_s Switching frequency
 R Equivalent load resistance
 A Voltage gain
 K_s Packing coefficient
 K_r Filling coefficient
 L_p Net thickness of the iron package
 K_u Utilization factor
 ϕ Flux per column
 L_{gross} Gross thickness
 μ_1 Induced EMF per turns
 I_1 Primary winding current
 I_2 Secondary winding current
 A_{copper} Wire diameter
 B_p Number of batteries wired in parallel
 V_{sin} Sinusoidal voltage peak magnitude
 V_{tri} Triangular carrier peak magnitude
