

Chapter 76

The Motivational Profile of Employees in Simulated Enterprises

Diana Andreea Mândricel
Titu Maiorescu University, Romania

ABSTRACT

Human motivation is the centre of interest for many specialists in management because it is the activity that produces the most profound economic consequences for organizations. As employees become more involved in IT processes, traditional methods of motivation are no longer efficient, and so within this paper drastic changes in practices related to human resources can be seen. This article intends to identify and analyse the motivational profile of employees in simulated enterprises as well as develop a plan to measure motivation adapted to the Romanian socio-economic reality. Thus, managers should avoid common approaches in the development of programs, models, and policies to help motivate employees. This will allow them to be able to create a work environment that will allow employees to motivate themselves because extrinsic motivation can decrease productivity.

INTRODUCTION

Understanding the motivational particularities of human resources has gained a special significance for the society of knowledge (Antoni, 2014; Guillén & Saris, 2013). Donovan et al. (2014) stated that a problem is socially relevant when it has an impact on the political, social, and economic life and when it contributes to the understanding of something that significantly affects the life of many people, or the understanding of some events. Without a doubt, motivation is a problem of temperament. Some individuals are more passionate than others and more dedicated to their work (Gong et al., 2009; Kara et al., 2007). There are methods likely to contribute to changes in attitude toward work for both the success of individuals in organizations and for the organization's success in the market. The new conditions of competition as well as the needs of personal autonomy and professionalism in the organization have led

to gradual changes in employee–enterprise relations, and thus it can be difficult to predict how relationships will change, based the science of management (Kark & Van Dijk, 2007; Shipper & Davy, 2002).

Today, employees must be informed, educated, protected, consulted, have certain autonomy, and be treated as collaborators (Van der Linden et al., 2017). Innovation in this area can be the modernization of people's work so that everyone contributes to surviving the competitive modern (Conway & Peetz, 2012; Gibson, 1973; Perel, 2005). This means changing social relations, transforming employees into actors and partners, and getting their active contribution to adaptation and progress. However, a good economic strategy is not enough anymore; we must add participative, open, and modern management and a strategy able to make every employee an actor and an effective and efficient partner. The new vision of training motivation requires the ability to influence employee behavior at work and achieve higher performance. Organizations have to motivate their employees if they want to become successful (Cohen, 1990; Liu & Ding, 2012; Rigby, 2003; Winter et al., 1998). One of the current trends moving in a wrong direction is that many organizations wish to have as few employees as possible at a much reduced expense, which they hope will help them manage their costs efficiently.

Thus, motivation is not just a theoretical concept. It is a valuable tool used increasingly by successful managers to obtain superior performance (Brumbach, 1988; Peters & Waterman, 1982). They understand that superior performance will result in optimal consumption, reduced costs, and higher quality conditions. To achieve optimum motivation, managers must take into consideration a permanent combination of extrinsic motivation and intrinsic motivation to achieve not only an increase in performance but also the development of human potential in workers' personal lives (Bierly et al., 2009). It is preferable that negative extrinsic reasons be applied only in exceptional conditions and for quantitative performances that require simple tasks. Positive extrinsic reasons play an important role in motivating performance activities.

Despite these shortcomings, management performance remains an important tool for organizations that seek to achieve high performance and is simultaneously one of the most important responsibilities of the manager. However, proper implementation of a performance management system in the organization, oriented to its needs and organizational culture, can only lead to significant profits for shareholders, managers, and employees.

It is possible for workers' performance to be low even when they are highly motivated because of low skills and undeveloped abilities (Levinson, 1972; Porter, 1985). It is also possible to obtain better performance even if motivational levels are not too high when individuals understand tasks well, and they give their best effort. Cook (2016) agreed with this statement, and they considered that performance is the result of individual characteristics, of the efforts of their work, and of the support they receive from their organizations. Managers must know that the function of creating value is and will continue to be the main condition of a productive organization's survival (Ingold et al., 2015). However, taking working conditions into account, to obtain value, organizations must look at, generate, share, and apply knowledge functions that develop from an environment where human resources play a central part instead of deriving them from technical capital.

To find a relevant answer to this question, the current paper intends to identify and analyze the motivational profile of employees in simulated enterprises (SEs) as well as develop a plan to measure motivation adapted to the Romanian socio-economic reality. We grouped the specific objectives of this study into theoretical objectives that emphasize the theoretical aspects, the analysis of the specifics of motivation of human resources/students in Simulated Enterprises, and the analysis of requirements
