Protoforms of Linguistic Database Summaries as a Human Consistent Tool for Using Natural Language in Data Mining

Janusz Kacprzyk, Polish Academy of Sciences, Poland
Sławomir Zadrożny, Polish Academy of Sciences, Poland

ABSTRACT

We consider linguistic database summaries in the sense of Yager (1982), in an implementable form proposed by Kacprzyk & Yager (2001) and Kacprzyk, Yager & Zadrożny (2000), exemplified by, for a personnel database, “most employees are young and well paid” (with some degree of truth) and their extensions as a very general tool for a human consistent summarization of large data sets. We advocate the use of the concept of a protoform (prototypical form), vividly advocated by Zadeh and shown by Kacprzyk & Zadrożny (2005) as a general form of a linguistic data summary. Then, we present an extension of our interactive approach to fuzzy linguistic summaries, based on fuzzy logic and fuzzy database queries with linguistic quantifiers. We show how fuzzy queries are related to linguistic summaries, and that one can introduce a hierarchy of protoforms, or abstract summaries in the sense of latest Zadeh’s (2002) ideas meant mainly for increasing deduction capabilities of search engines. We show an implementation for the summarization of Web server logs.

Keywords: computing with words and perceptions; data mining; fuzzy logic; fuzzy querying; linguistic summarization; protoform

INTRODUCTION

Data summarization is one of basic capabilities needed by any “intelligent” system. Since for the human being the only fully natural means of communication is natural language, a linguistic summarization would be very desirable, exemplified by, for a data set on employees, a statement (linguistic summary) “almost all young and well qualified employees are well paid”.

This may clearly be an instance of a paradigm shift that is advocated in recent time whose prominent example is the so-called “comput-
In Yager’s (1982) approach, we have:

- $V$ is a quality (attribute) of interest, e.g. salary in a database of workers,
- $Y = \{y_1, ..., y_n\}$ is a set of objects (records) that manifest quality $V$, e.g. the set of workers; hence $V(y_i)$ are values of quality $V$ for object $y_i$,
- $D = \{V(y_1), ..., V(y_n)\}$ is a set of data (the “database” on question)

A linguistic summary of a data set (data base) consists of:

- a summarizer $S$ (e.g. young),
- a quantity in agreement $Q$ (e.g. most),
- truth $T$ - e.g. 0.7,
- a qualifier $R$ (optionally), i.e. another linguistic term (e.g. well-earning), determining a fuzzy subset of $Y$.

as, e.g., “$T(\text{most of employees are young})=0.7$”. The truth $T$ may be meant more generally as, e.g., validity.

Given a set of data $D$, we can hypothetize any appropriate summarizer $S$ and any quantity in agreement $Q$, and the assumed measure of truth will indicate the truth of the statement that $Q$ data items satisfy $S$.

We assume that the summarizer $S$ (and qualifier $R$) is a linguistic expression semantically represented by a fuzzy set as, e.g., “young” would be represented as a fuzzy set in $\{1, 2, ..., 90\}$. Such a simple one-attribute summarizer serves the purpose of introducing the concept of a linguistic summary but it can readily be extended to a confluence of attribute values as, e.g., “young and well paid”. Clearly, the most interesting are non-trivial, human-consistent summarizers (concepts) as, e.g.: productive workers, involving complicated combinations of attributes, e.g.: a hierarchy (not all attributes are of the same importance), the attribute values
