ABSTRACT
The current research tries to offer a conceptual model in order to create trust among people for choosing these virtual universities. To this end, the conceptual model of research has been designed with nine factors. The relationship among factors tested by using statistical methods such as factor analysis and path analysis. In the end, five components were established to be among the affecting factors of student trust towards this type of universities. They are: academic reputation of virtual universities, administrative efficacy of virtual universities, size of virtual universities, economical factor of studying in virtual universities and the suitable environmental conditions for virtual universities activity. However, it was established that the role of each of these components in creating trust towards virtual universities were different from those predicted by the researchers. Also it was established that student’s willingness toward choosing virtual universities is influenced by the trust factor.

INTRODUCTION
The emergence of information and communication technologies (ICT’s) and their use in training of people has resulted in formation of virtual universities. Most countries with more or less similar goals have acted to establish such universities. Islamic republic of Iran too, as a developing country in Asia has taken such steps. The result of this effort up to present time, has been designing of ten virtual universities in order to satisfy the educational needs of the great number of people requesting to benefit from higher education in Iran (Sarlak and Abedi Jafari, 2004). The Iranian virtual universities includes:

- Tehran virtual university: http://cel.ut.ac.ir
- Isfahan virtual university: http://vu.ui.ac.ir
- Elm va sanat virtual university: http://www.elearning-just.com
- Shiraz virtual university: http://www.shirazu.ac.ir
- Sharif virtual university: http://vu.sharif.edu
- Iranian virtual university: http://iranu.com
- Oloome hadis virtual faculty: http://vu.hadith.ac.ir
- Peyame noor virtual university: http://www.aictc.com/pn/
- Iran internet based university: http://www.net2university.com

Research Problem
At the present time, Iranian virtual universities are operating beside the Non-virtual universities. The problem that virtual universities confront is low recognition level of people applying to these types of universities and the consequent low level of their trust to these universities.

Research Goals
The current research tries to offer a conceptual model in order to create trust among people for choosing these virtual universities.

Research Questions
The research questions are as follow:

- What are the affecting factors on students trust towards virtual universities?
- Is there a relationship between student’s trust towards virtual universities and their willingness to choose these types of universities?
- Can we show this relationship based on a conceptual model?

Research Hypothesis
H1: There is a meaningful relationship between people’s trust to Virtual Universities and academic reputation of Virtual Universities.
H2: There is a meaningful relationship between people’s trust to Virtual Universities and administrative efficacy of Virtual Universities.
H3: There is a meaningful relationship between people’s trust to Virtual Universities and the size of Virtual Universities.
H4: There is a meaningful relationship between people’s trust to Virtual Universities and Virtual Universities being cost-effective.
H5: There is a meaningful relationship between people’s trust to Virtual Universities and suitable environmental conditions for Virtual University activity.
H6: There is a meaningful relationship between the academic reputation of Virtual Universities and administrative efficacy of Virtual Universities.
H7: There is a meaningful relationship between academic reputation of Virtual Universities and the size of Virtual Universities.
H8: There is a meaningful relationship between academic reputation of Virtual Universities and Virtual Universities being cost-effective.
H9: There is a meaningful relationship between academic reputation of Virtual Universities and suitable environmental conditions for Virtual University activity.

References
H16: There is a meaningful relationship between a person’s trust towards Virtual Universities and perceiving a lower level of risk in studying in Virtual Universities.

H17: There is a meaningful relationship between a person’s trust towards Virtual Universities and his attitude towards studying in Virtual Universities.

H18: There is a meaningful relationship between perceiving a lower level of risk in studying in Virtual Universities and his attitude towards studying in Virtual Universities.

H19: There is a meaningful relationship between a person’s attitude towards studying in Virtual Universities and his willingness to choose Virtual Universities for study.

H20: There is a meaningful relationship between perceiving a lower level of risk in studying in Virtual Universities and his willingness to choose Virtual University for study.

H21: There is a meaningful relationship between a person’s trust towards Virtual University and his willingness to choose Virtual Universities for study. (Major hypothesis).

Research Backgrounds
In research process we find bellow recourses:

- Fifty three resources were found about Trust and virtual universities in Persian texts.
- More than 500 resources were found about Trust and virtual universities in Latin texts.
- No research were found under the title “trust to virtual universities”.
- The research done by Sirkka L. Jarvenpaa and Noam Tractinsky and Michael Vitale in 2001 year under title: Consumer Trust in an internet store were found more related to the present research subject.

Literature Review
In this research, literature review includes 2 sections:

1) trust
2) virtual universities

1) Literature review on trust

1.1) trust etymology: Trust is a Middle English word, probably of Scandinavian origin; akin to Old Norse traustr; akin to Old English træow. Meaning: faithful (Merriam Webster dictionary).

1.2) trust definitions: There is no one generally accepted definition of trust between researchers (Cred and miles ,1996). Trust has been defined by researchers in many different ways, which often reflect the paradigms of the particular academic discipline of the researchers (grabner- krauter & Kaluscha, 2003).

- Personality psychologists traditionally have viewed trust as a belief, expectancy, or feeling that is deeply rooted in the personality and has its origins in the individual’s early psychological development.
- Social psychologists define trust as an expectation about the behavior of others in transactions, focusing on the contextual factors that serve either to enhance or inhibit the development and maintenance of trust.
- Economists and sociologists have been interested in how institutions and incentives are created to reduce the anxiety and uncertainty associated with transactions.
- Within business schools, there are different approaches to the study of trust across domains such as finance, marketing and management, partly drawing on trust constructs developed in other disciplines.
- Stephen P. Robbins (2001) define trust as: A positive expectation that another will not behave - through words, actions, or decisions - opportunistically.

1.3) trust dimensions: New evidence show that trust consist of five dimensions: integrity, competence, consistency, Loyalty and openness (Robbins, 2001).
- Integrity includes honesty & truthfulness.
- Competence, includes technical, interpersonal knowledge & skills.
- Consistency includes predictability, & good judgment (congruence between words & deeds).
- Loyalty includes willingness to protect & save face for another person.
- Openness, include telling the full truth and not just part of it.

1.4) trust bases: There are three bases for trust (Robbins, 2001):
- Deterrence Based Trust: based on fear and force (most fragile).
- Knowledge Based Trust: based on predictability over time (most organizational relationships).
- Identification Based Trust: based on emotional connections and mutual understanding of wants and needs (highest level of trust).

1.5) Trust components or basic model of trust: The trust includes three components: trustor, trustee and context (Powers, 2001).

1.6) Trust types: there are three types of trust: Personal trust , System trust and institutional trust (Nooteboom & Six, 2003).
- Personal trust: Based on experiences individuals make with each other in the course of frequent interaction over a longer period of time.
- System trust: Trust an individual has in the functioning and in the reliability of impersonal social structures.
- Institutional trust: Trust between individuals Vis - a - Vis existing impersonal social rules.

1.7) Trust subject: One can trust to Material objects, Empirical regularities , Laws of nature ,People ,Authorities , Organizations, Institutions and higher powers (Nooteboom & Six, 2003).

1.8) Theories underlying trust:
- Rational choice theory: This theory based on this idea that all action is fundamentally ‘rational’ in character and that people calculate the likely costs and benefits of any action before deciding what to do. This approach to theory is known as rational choice theory, and its application to social interaction takes the form of exchange theory.
- Exchange theory: Exchange theory derives from economics’ rational choice theory and the study of relationships and “exchanges”. It argues that individuals evaluate alternative courses of action so that they get best value at lowest cost from any transaction completed. According to exchange theory, individuals form associations on the basis of trust, and try to avoid exchange relationships that are likely to bring more pain than pleasure(Jarvenpaa and others , 2000 ).
- Balance theory: Balance theory suggests that people tend to develop positive attitudes towards those with whom they have some prior association (Jarvenpaa and others , 2000 ).
- Reasoned action and planned behavior theories: As shown in figure 1, the theories of reasoned action (Fishbein & Ajzen, 1975) and planned behavior (Ajzen, 1985) assert that behavior is influenced by behavioral intention, and that intention is determined by attitudes. Attitudes mediate between beliefs and intention, although beliefs can also have a direct effect on intention.
The theory of planned behavior states that in addition to person’s efforts for acting in a certain way, it states that a set of uncontrolled internal and external factors too can have effects on a person’s behaviors. For example, a person’s perception on the risk of that behavior is one of the controlling factors of behavior that can be effective whether that behavior takes place or not.

2) Literature review on virtual universities

2.1) Definition of virtual university: From the time of emergence of virtual university various definitions have been offered on this phenomenon, here we refer to a few definitions:

“Virtual University” is a learning environment based on network that has been designed for the transfer of content and expansion of university education (Harasim, 1997).

“Virtual university” is a university without walls and uses information and communication technologies in order to transfer educational materials to students. (Lindquest, 2002)

“Virtual university” is a university based on internet, this university lacks physical structures and uses synchronous and Asynchronous Technologies for transferring of contents and offering educational services to students. (Sarlak and Abedi Jaffer, 2003).

2.2) Main Characteristics of a virtual university

The main characteristics of a virtual university are as follow (barjis, 2003):

- The university is completely based on ICT facilities with constant access to the Internet.
- The university provides selectable and flexible study programs anywhere and at any time in the range of its coverage (city, state, country or continent).
- Students, staff and faculty are IT competent...on the desktop, in the classroom and lecture hall, and in the simulation “center.”
- State-of-the-art hardware and software are at hand.
- Institutional IT infrastructure (classroom, lecture hall, campus) is state-of-the-art.
- Academic programs are IT-based, “as appropriate”.
- University is a “learning organization”...shared vision...shared situational awareness...everyone contributes...is flat, seamless, tailorable and virtual.
- Students are taught and practiced in the art and science of “thinking in the information age”.

2.3) Virtual university mission:

The mission of a virtual university (barjis, 2003) is Evolving:

- from an Industrial Age University to an Information Age University.

- from bricks-based university to electronic components-based university
- from walls surrounded university to wires surrounded university.
- from human professors to digital Professors
- from hard books to electronic books

2.4) Characteristics of virtual universities

DESIGNING RESEARCH CONCEPTUAL MODEL

The conceptual model of research is a research tool that determines research variables and their relationships. The conceptual model of this research shown in figure 3.

The mentioned conceptual model derived from research questions and hypothesis and literature review. This conceptual model is based on 2 following research model.

1) The basic model of trust

The basic model of trust shown in figure 4.

According to this model the trust process includes three components includes: trustor, trustee and trust context which this context trust occur (Powers, 2001).

Figure 1: Reasoned action and planned behavior theories

Figure 2: Characteristics of virtual universities

Figure 3: Research conceptual model
RESEARCH METHODOLOGY

As Hussey and Hussey(1997) described methodology as general approach to research which includes qualitative and quantitative approach, in this research too, we employed a Synthetic approach for gathering necessary information and doing research. The present research methodology shown in figure 6.

As shown in figure 6, we used a Qualitative approach for identification of students trust antecedents and a Quantitative approach for determining validity of research Factors (9 factors which used in research model) and testing research hypothesis.

Statistical community of research is the undergraduate freshmen students of Virtual Universities in the first semester of 2004-2005. We are to say there are only 2 virtual universities i.e. Elm va sanat virtual university and Shiraz virtual university to start their systematic activity out of a whole number of 10 virtual universities.

Level of current analysis is concentrated on individual. Subject of trust [person’s trust to organization] is the main center of current analysis and research (Mirzaei , 1992). In this research the unit of analysis is Virtual Universities. According to published statistics, the statistical community size of current research is about 1293 students (1000 students in Elm Va Sanat virtual university and 293 students in Shiraz Virtual University).

The research sample size is 400 students was determined by use statistical formula (Azar, 2001). The Sampling method in this research is classified random method. By employing this method the sample size (400 students) divided to 2 category. 308students from Elm Va Sanat virtual university and 92 students from Shiraz Virtual University were randomly selected.

In pre-test whose goal is the final evaluation of measuring tool, about 50 questionnaires were distributed among the potential respondents, from this number 10 incomplete questionnaire were reject by list wise method, and about the rest of the 40 questionnaires (about10% of total sample ) became basis of reliability and validity test, the results of reliability and validity test shown in figures 7 and 8.

The reliability index is alpha and in order to increase alpha in introductory test unstable choices were deleted. The acquired alpha for the whole scale is about 92 percent which has been above 70 percent and is indicative of scale’s stability.

In order to answer this question whether questionnaire has the necessary validity in addition to implementation of expert’s point of views, factor analysis and K-M-O test has been used. Since size of K-M-O of entire research questionnaire is equal to .771 and significant level derived from statistical community size of current research is about 1293 students (1000 students in Elm Va Sanat virtual university and 293 students in Shiraz Virtual University).

Figure 6. Research methodology

Figure 7. Reliability analysis-scale (alpha)
Bartlett test is 0.0005 and is smaller than evaluation level (0.05), thus sampling sufficiency and beneficiary of factor analysis were proved and concluded that measurement tool has the necessary reliability and validity.

In next stage in order to understand the underlying components variables of research conceptual model, factor analysis was used, after confirmation of components, Normality of confirmed components was tested.

In this section the result of research hypothesis test that derived from path diagrams have been shown in figure 13.

in figure 9 we can see, the underlying indexes of 9 factors of conceptual model.

After it has been determined that distribution of components are normal, the derived data from factor analysis was stored to be use in path analysis method.

The result of path analysis method shown in figures 10 And 11.

The model evaluating indexes shown in figure 12.

The above indexes indicate model good fitness.

In this section the result of research hypothesis test that derived from path diagrams have been shown in figure 13.

</table>
As can be seen, except hypothesis 18th and 20th whose t is less than 2, the amount of t of the rest of the hypothesis are more than 2 and it means that its meaningful level is less than 0.01. Its concluded that H1 hypothesis of all hypothesis except 18th and 20th hypothesis are confirmed.

Extraction of structural equations:
In order to determine the level of effects on Internal variables (dependent variables: \( Y_1, Y_2, Y_3, Y_4 \)) from the rest of research variables, structural Equations have been designed and are shown below.

\[
Y = 0.23X1+0.14X2+0.16X3+0.15X4+0.23X5
\]

The obtained explanation coefficients for the mentioned variables is indicative that about 68 percent of total \( Y_1 \) variable changes by five variables of \( X_1, X_2, X_3, X_4, X_5 \) about 73 percent of total \( Y_2 \) variable changes by seven variables of \( Y_1, Y_2, Y_3, X_1, X_2, X_3, X_4 \) about 74 percent of total \( Y_3 \) variable changes by six variables of \( Y_1, Y_2, Y_3, X_1, X_2, X_3 \) and about 72 percent of total \( Y_4 \) variable changes by eight variables of \( Y_1, Y_2, Y_3, X_1, X_2, X_3, X_4 \) and \( X_5 \) have been explained.

In other words about 32 percent of \( Y_1 \) variable changes, about 27 percent of \( Y_2 \) variable changes, about 26 percent of \( Y_3 \) variable changes and about 28 percent of \( Y_4 \) variable changes have been explained by the variables outside the model.

DISCUSSION AND CONCLUSION
Discussion about factors affecting applying students’ trust to Virtual Universities (y1 factor):

The theoretical expectation was that the academic Reputation of Virtual Universities (X1 factor) have a bigger role in creating trust in applying students’ in comparison to other factors of the model. The results of present research confirmed this expectation. However what was not expected was the fact that role of suitable environmental conditions (such as mass media attitudes toward VU, families attitudes to VU, and sufficient IT infrastructures in country) for activity of Virtual Universities (X5 factor) in creating trust in applying students was the same level as that of academic reputation of Virtual Universities. perhaps the reason for the importance of suitable environmental conditions for activity of Virtual Universities is because if mass media and families have a positive attitudes towards Virtual Universities, then applying students’ due to getting their effects from the mentioned organs would have a positive attitudes and higher trust towards these universities.

Discussion about factors affecting applying students’ attitudes toward study in Virtual Universities (y2 factor):

According to the theories discussed in this research, the theoretical expectation was that applying students’ attitudes towards education in Virtual Universities is effected by two factors includes “applying students trust “ and perceiving a lower risk of education in VU (y1 and y3 factor). Results showed on the contrary to trust factor which has the most effect on students attitudes, perceiving a lower risk of education in Virtual Universities doesn’t result necessarily to a more positive attitude in applying students toward studying in Virtual Universities.

As well as was determined that there is a relationship between applying students attitudes and five research independent variables include: Academic Reputation, Administrative efficacy, size of Virtual Universities, education being cost effective in V. U. and suitable environmental conditions for virtual university activity., results showed that persons attitude towards education in V. U. gets effects from the mentioned factors.

Discussion about factors affecting applying students’ perceived risk to Virtual Universities (y3 factor):

According to theories and the derived conceptual model from theory, the expectation was that the perceived risk factor (y3 factor) be only affected by applying students trust factor(y1 factor), however the results showed that this expectation in not true and this component is effected by 5 components of Academic Reputation, administrative efficacy, size of Virtual Universities, education, being cost effective and suitable environmental conditions.

Evaluations show that two factors of education being cost effective (x4) and academic reputation of Virtual Universities (x1) have respectively the highest and the least role in perceiving a lower risk of education in Virtual Universities from applicant’s point of view.

Discussion about factors affecting applying students’ willingness choose Virtual Universities for (y4 factor).

The theoretical expectation was that person’s willingness to choose Virtual Universities (y4) is only effected by two factors of attitude and perceived risk.

Results while confirmed relationship between person’s willingness to choose Virtual Universities (y4) is only effected by two factors of attitude and perceived risk.

Recommendations
The results of this study provide support for the conceptual model of research and for the hypotheses regarding the directional linkages among the model variables. The model appears to be a reasonable starting point for developing a theory of applying students trust in virtual universities. It is suggested that the following points be taken into consideration for future researches and Iran’s virtual universities.

1 – With due attention to the fact that acquired explained coefficient for 4 research dependent variables includes: “applying students trust towards Virtual Universities”, “persons attitude towards education in Virtual Universities”, “perceiving a lower risk of education in Virtual Universities” and “persons willingness to choose Virtual Universities for education are respectively 0.74, 0.73, 0.63, 0.72”, thus its suggested that future researches evaluate the affecting factors on these 4 components that were not explained by current research model.

2 – In relation to the role of two component “Academic Reputation” and “suitable environmental conditions for Virtual Universities activity in creating persons trust in entering universities “. 
country’s Virtual Universities are suggested to pay more attention to these two components and help for their promotion. In this research only the effecting factors on person’s trust towards education in Virtual Universities got attention, therefore its suggested to future researches that effecting factors on Instructors, trust, virtual university employees trust to this university and also mass media and people in general level of trust towards Virtual Universities be evaluated.

The current results suggest that the presence of a non virtual structure might have an effect on applying students trust in an virtual universities.
