### **ABSTRACT**

*Nanotechnology is increasingly being employed in the areas of food production and packaging. While there exists considerable research that analyses consumer trust and perception of nanotechnology use in the food sector, the B2B sector has widely been neglected. This research project analyzes the influence of perceived quality and psychological factors in adopting a new nano-based technology that increases storage life of fruits and vegetables. The research context is Iran and neighboring countries. The results show that customer acceptance of using nanotechnology is influenced by both quality dimensions (performance, features, reliability, conformance, durability, serviceability, aesthetics, perceived quality) and psychological dimensions such as perceived risk and trust. The research also reveals individual differences in accepting nano-technology, depending on the function held by the employee. The authors interpret the results from a culture perspective.*

## **INTRODUCTION**

Nanotechnologies are set to impact the food industry at all stages of production from primary production at farming level, due to advances in pesticide efficacy and delivery (novel formulations and better crop adherence), to processing where emulsion creation and encapsulation have progressed to the nanoscale (Neethirajan & Jayas, 2011). Concrete applications in this area include the development of improved tastes, color, flavor, texture and consistency of foodstuffs, increased absorption and bioavailability of nutrients and health supplements, new food packaging materials with improved mechanical, barrier and antimicrobial properties, and nano-sensors for traceability and monitoring the condition of food during transport and storage (2009, <http://www.innoresearch.net>).

Public perception is crucial to the realization of these technological advances. As contested by Cobb and Macoubrie already in 2004, trust plays an important part in public opinion about nanotechnology. Research in a consumer context has shown that individuals expose different perceptions with regards to the application of these high-tech products: Some believe the benefits of using nanotechnology products outweighs their risk and promote the use of nano-tech products. Other consumers remain more skeptical, partly because they lack familiarity with and knowledge of nanotechnology (Lee, Scheufele & Lewenstein, 2005; Currall, King, Lane, Madera & Turner, 2006). Overall, food-related applications in general are viewed less positively, or at least differently, to other areas of application (Cobb & Macoubrie, 2004). Research shows that this may vary between different cultural or regional contexts (Kahan, Braman, Slovic, Gastil & Cohen, 2008). For instance, the European public seems to be less optimistic about nanotechnology compared with consumers in the U.S. (Gaskell, Eyck, Jackson, Jonathan & Veltri, 2004). The public opinion in Europe compares the commercialization trajectory of emerging applications of nanotechnology frequently to that of genetic modification of foods (Mehta, 2004).

Approaching the development of novel food technologies through the analysis of psychological, social, political and historical issues is an essential element of commercialization. If consumers feel that they can control the consumption of associated products (and of course this requires more widespread industry acceptance of regulated labeling strategies, and international harmonization of labeling requirements), it is anticipated that consumer acceptance is likely to be higher compared to situations where applications are uncontained (in particular in terms of environmental release) and untraceable (Frewer Bergmann, Brennan, Lion, Meertens, Rowe, Siegrist, & Vereijken, 2011). While the focus on consumer perception of nano-technology
