# Chapter 5 Setting Up Education-Based "Crosswalk Analyses" on an Online Survey Platform

#### ABSTRACT

Practically, crosswalk analyses in education may be used to identify gaps for decision making and program planning, enable cross-system comparisons, promote crossdisciplinary work, and others. Often, crosswalk analyses require the expertise of a cross-disciplinary and/or distributed team. Setting up a crosswalk analysis on an online survey platform stands to benefit this collaborative work in ways that are more powerful than a co-edited shared online file. This chapter describes some ways to set up education-based crosswalk analyses on an online survey platform and highlights some online survey features that can enhance this work.

#### INTRODUCTION

"Crosswalk analyses" are a fairly modern analytics approach which maps the granular elements of one system with those of another. One common approach is to map one database schema to that of another, so the data from both databases can be melded and somewhat interchanged. Outside of database administration, though, crosswalk analyses are used in a more loosely coupled way to map one system to another laterally (in one direction), and these may include schemas, ontologies, taxonomies, frameworks, standards, compliance criteria, performance criteria, datasets (including structured and semi-structured data), and others.

#### Setting Up Education-Based "Crosswalk Analyses"

A "crosswalk analysis" bridges between at least two systems to identify commonalities and differences (comparisons and contrasts) between them, in order to enable integration of datasets, programmatic gaps analyses, cross-disciplinary work, and other applications. The systems compared include a range of content types, including schemas, ontologies, taxonomies, frameworks, standards, compliance criteria, performance criteria, datasets, and others. Crosswalk analyses are considered efficient because they maintain the integrity of the compared systems—by keeping the terminology and phrasing verbatim—by showing connectivity at a basic unit level of analysis for each respective system. As such, they do not break down silos but connect "content silos" (Johnston, June 22, 2015). [Note: Such crosswalk analysis bridging can also occur more abstractly or at a higher level of abstraction, but for usability, the precision at the most granular units of analysis seem to be preferable. These have also been referred to as "equivalent elements" ("Schema crosswalk," Sept. 28, 2018).] The innovation of this analytic technique is in the crosswalk, and the overlap between the systems is somewhat interpretive (and defined by the objectives of the crosswalk analysis). The crosswalk itself is partial and selective and does not include all potential overlaps between the two disparate systems. (Figure 1) Or, not all overlaps between two systems will likely be seen as relevant. This is not to suggest that some crosswalks may not be comprehensive, and in some cases, that level of detail may be required and often depicted in a crosswalk analysis matrix.
