

Chapter VI

A Database Project in a Small Company

(or How the Real World Doesn't Always Follow the Book)

Efrem Mallach

University of Massachusetts Dartmouth, USA

EXECUTIVE SUMMARY

This case describes the development of a database system used to track and analyze press comments by experts on the information technology industry. The system was developed in a haphazard fashion, without the benefit of professional developers, originally based on a loosely organized collection of data assembled by a staff member, with little visibility into its ultimate uses. Design decisions made early in the project without careful consideration were difficult to change, or were never changed later, even after their negative impact was evident. The system provided real value to its users, but use of proper development disciplines could possibly have reduced some problems while not reducing that value.

ORGANIZATION BACKGROUND

The job of an *industry analyst* (Columbus, 2004) is to interpret goings-on in a particular field to nonexperts, advising them on where the field is going and which vendors, products, or services are most likely to suit a particular user need. Because information and communication technologies (ICTs) are complex, rapidly changing, and “mission-critical” to businesses of all types, analysts¹ are especially important in that field. Their recommendations move large amounts of revenue toward vendors whose products and services they favor, or away from those about whom they feel negatively.

In 2005, there are about 500 (Kensington Group, 2004) industry analysis firms (also known as *research firms* when this is unlikely to cause confusion with other types of research) worldwide. Total industry revenue can be estimated at roughly \$3 billion, based on published annual revenue of

industry leader Gartner being about \$900 million (Gartner Group, 2005), and the existence of several privately held firms employing over 100 analysts each, such as International Data Corporation with over 600 (IDC, 2005) and Forrester Research with nearly 200 (Forrester, 2005). It is reasonable to estimate that the industry employs at least 2,000 analysts, probably considerably more.

As a result of analysts' influence on the market, ICT vendors pay a great deal of attention to them. Most large vendors have a dedicated analyst relations department. The efforts of Alcatel (2005), Computer Associates (2005), Sybase (2005), and Hewlett-Packard (2005), all in different segments of the IT industry, are representative. Vendors spend large sums courting analysts, visiting them, putting on events for them at which they showcase their products, and generally trying to convince them that the vendor's offering is superior. Since they want to do this as well as possible, vendors often look to outside advisors (Insight Marketing, 2005; Tekrati, 2005) to evaluate and improve their analyst relations programs.

The organization discussed in this case, which will be referred to² as Balmoral Group, Inc., was such a consulting firm. It specialized in advising ICT vendors about the impact of industry analysts on their business, and on how to work with them most constructively. As the case opens in 1999, it employed 5 full-time people plus a few part-time contractors for peak survey work. At the end of the case in the summer of 2003, it employed 18, over half of whom were primarily involved with the system described here.

Balmoral Group was founded when its two cofounders, Isabelle Oliviera and Lawrence Ackerman, met. Ackerman had a solo consulting practice in this field. Among other things, he had begun conducting multiclient studies in which analysts told him what they needed in terms of support from vendors, and rated vendors based on how well they provided this support. Oliviera worked for a large hardware vendor and was about to leave it to start her own consulting practice in

the same field. Since the two were on opposite coasts of the U.S., they chose to join forces and named their joint venture Balmoral Group. Ackerman was named CEO; Oliviera president. A few years later, in 1996, they incorporated to set the stage for further expansion.

The firm's initial offerings included the multiclient studies originally done by Ackerman, workshops at which vendor analyst relations professionals could learn the elements of their profession, and custom consulting services. Among the questions that arose frequently in consulting work were "Which analysts are most influential in our space, which are most likely to be quoted about us, and what are they saying?" Balmoral Group, at that time, lacked a systematic way to approach these questions.

The database system described in the rest of this case was originally intended to answer such questions. It eventually provided another offering for the firm that accounted for a large fraction of its income by 2002 and led to expanding its headcount to over 15 people. However, its development proceeded in an unplanned fashion and was characterized by technical decisions that, in retrospect, might better have been made differently. The situation described in the case is in this respect typical of many small organizations. The system development processes described in books are often followed, at least in principle, by larger firms with dedicated MIS staffs, but the small-business reality is not usually as professional in that respect.

Oliviera and Ackerman remained in charge of the firm through 2002. In 2000 they divided their responsibilities, with Oliviera in charge of external activities including sales and customer relations, and Ackerman in charge of internal ones including research projects and databases. In early 2002, Oliviera took over as sole manager while Ackerman prepared for a career change. As a prearranged part of this orderly transition, he remained with the firm through the period covered by this case, leaving in the summer of 2003.
