ABSTRACT

This chapter describes innovative strategies to integrate STEM and literacy into early childhood deaf education and provide young learners with the skills and confidence they need to succeed in a dynamic world. The chapter highlights the importance of recognizing the unique needs of deaf children and incorporating visual, hands-on, and bilingual approaches that utilize sign language and visual learning tools. Educators can create engaging, multimodal learning experiences that encourage critical thinking, problem-solving, and language acquisition by connecting STEM concepts to literacy development. The chapter highlights best practices, such as interactive technology, collaborative projects, and culturally responsive teaching methods that affirm deaf identities and promote inclusion. It also explores the role of trained educators and supportive policies to close education gaps. Ultimately, the chapter argues for a transformative approach to early childhood deaf education that ensures all young learners have equitable access to quality STEM and literacy education.

THE INTERSECTION OF STEM, LITERACY, AND EARLY CHILDHOOD DEAF EDUCATION

Science, technology, engineering, and mathematics (STEM) and learning instruction are essential to prepare all learners, including deaf students, for the challenges of the 21st century. These subjects promote critical thinking and problem-solving skills and open doors to meaningful careers and active social participation. However, the educational pathways of deaf learners are uniquely shaped by their communication needs, language development, and accessibility requirements (Anwar et al., 2024). Traditional STEM and literacy instruction frameworks often do not adequately address the diverse needs of deaf learners, resulting in achievement and participation disparities. Deaf students often struggle to access STEM content due to language barriers, inappropriate instructional strategies, and inadequately trained teachers. These hurdles are further exacerbated by the complexity of STEM vocabulary and concepts, which require solid foundational literacy skills to be fully understood. For deaf and hard of hearing (DHH) learners, literacy development can be a significant challenge, mainly when access to natural language is limited during early development. Despite these barriers, with appropriate interventions, accessible resources, and inclusive teaching practices, DHH learners can thrive in STEM and literacy classrooms and contribute to these fields (Ellington et al., 2021).

Early childhood education (ECE) is a critical period for language acquisition, cognitive development, and foundational skill development. For DHH children, this period is significant as it often determines long-term academic and social outcomes. One of the most significant challenges in ECE for deaf children is providing timely access to robust language models, whether through American Sign Language (ASL), spoken language, or a combination of both. Delays in language acquisition can lead to long-term literacy deficits, impacting a child's ability to engage with STEM content. Another challenge is the limited availability of early intervention programs explicitly designed for DHH children. These programs often lack the resources and trained professionals to provide individualized support. Additionally, many families of DHH children have difficulty accessing these services due to socioeconomic factors, lack of education, and geographic limitations. Despite these challenges, significant opportunities exist to improve early childhood deaf education. Technology advancements such as hearing aids, cochlear implants, and video-based learning platforms have expanded language and literacy development opportunities (Alexandre et al., 2022). Early exposure to bilingual education, where children learn to sign, speak/write language, has improved cognitive flexibility and literacy. Additionally, incorporating STEM concepts into ECE through hands-on, visual, and interactive approaches can spark curiosity and build foundational skills in young DHH learners. Inclusive education confirms that all learners, regardless
